

Did you know...

Your block is positioned perfectly for a Passive house, so you can live in the most energy-efficient, healthy & comfortable environment imaginable?

Your Passivhaus homes are built to the highest standards possible.

This Passive House standard guarantees that your home will meet the designed energy usage delivering inside temperatures of 20 to 25 degrees all year-round.

Your Passivhaus

All YourPassivHaus homes are:

Insulated

Special windows and a building shell consisting of highly insulated exterior walls, roof and floor slab keep the desired warmth in the house – or undesirable heat out.

Efficient

Passive House buildings allow for energy savings of up to 90% compared with typical existing buildings and over 75% compared with average new best-practice constructions. Similar energy savings have been demonstrated in warm climates where buildings require more energy for cooling than for heating.

Comfortable

Passive House buildings are also praised for their high level of comfort. They use energy sources inside the building such as the body heat from the residents or solar heat entering the building – making heating a lot easier.

Ventilated

A ventilation system consistently supplies filtered clean air making for superior air quality without causing any unpleasant draughts. A highly efficient mechanical heat recovery unit allows for the heat contained in the exhaust air to be re-used.

Ready to move in within 8 to 10 weeks from a knockdown.

These are only a few of the benefits of a YourPassivHaus home. From consultation to design, from knockdown to construction, the YourPassivHaus team are committed to making sure you get the passive, energy-efficient, home you want.
